Calibration set

Which N conforming parts set T_α; the size N

Type A: 1000 resampled calibration sets vs Beta(N − k + 1, k); curves: N = 50, 100, 500

Normal reference

Which M conforming parts form the bank B; the size M

Type A: 5 bank draws × 5 support draws; M = 5, 10, 20, 50

Support set

Which K examples represent each defect type; K

Type A: 5 support draws (crossed with the bank)

Reported results: false-reject rate, escapes per 1000 parts, balanced accuracy, latency and energy

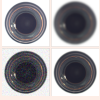

Test sample

Finite number of test parts and objects

Type A: bootstrap over test parts and objects (small plot: gain per VisA object)

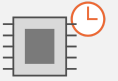

Influence quantities

Lighting, gamma, noise, blur, JPEG, shift, rotation

Sensitivity with and without recalibration; agreement over repeats

Computing platform

Precision, engine, process session, clock and temperature

Type A: 10 sessions, 5 energy windows. Type B (accuracy only): PyTorch–TensorRT difference
