
(a) Fixed before any query
M conforming parts
Patch bank B
M × 576 patches
Threshold τ:
0.99 quantile,
leave-one-out
broken (large)
broken (small)
contamination
Class prototypes p_c
(b) For each query
Query: bottle (whole image)
(1) Score: a(t), distance to the nearest patch in B
28 of 576 patches exceed τ
(2) Gate: normal variation ends at τ
(3) Weight: w = max(a − τ, 0)
Normal-referenced evidence selection
Appearance h_A: weighted patch mean
Deviation h_R: weighted t − $nn_B(t)$
Global feature g
Distance to each p_c; z-scores of the three summed
ŷ = broken (small)
